105 Oral Presentations

**) 85 papers published in peer reviewed journals including leading journals, such as Lancet Neurology, Nature Genetics, JAMA Neurology, Brain, Annals of Neurology, EBio Medicine, Neurology and Epilepsia.*

1. Introduction – Filadelfia

Filadelfia - The Danish Epilepsy Centre - offers highly specialized healthcare services to epilepsy patients of all ages. As the sole specialized epilepsy hospital in Denmark, we receive referrals for rare and complex epilepsies. Our focus is on delivering high-quality comprehensive clinical care, research and development are internationally recognized. In 2023, our team, consisting of three professors, two associate professors, two postdocs, and 12 PhD students, published 85 research papers, including in leading journals in the field of clinical neuroscience, and delivered 105 oral presentations at international medical conferences.

Our researchers are affiliated with the University of Copenhagen, the University of Odense, and Aarhus University. They hold important positions of trust in national and international scientific societies and serve as key hubs in numerous international epilepsy research networks.

Filadelfia, The Danish Epilepsy Center, is a non-profit foundation with an independent Board of Directors. In addition to the Epilepsy Hospital, Filadelfia comprises a center for neurorehabilitation, specialized institutions for mentally handicapped persons, and the only special school for children and young people with epilepsy in Denmark. Filadelfia is publicly funded and an integral part of the Danish Healthcare System. The Epilepsy Hospital receives patients from the five Danish Regions, i.e., the public hospitals and practitioners. The specialized social institutions receive clients from the Danish Municipalities.

We are proud to publish this report and hope it will encourage further collaboration for the benefit of persons with epilepsy worldwide.

As the Medical Director, I want to express my gratitude to all the collaborators in the research teams for their efforts and great achievements in 2023, and to Professor Sándor Beniczky for his leading role in producing this research report.

Jens-Otto Skovgaard Jeppesen
Managing Hospital Director
Danish Epilepsy Centre, Filadelfia

Mads Ravnborg
Medical Director, DMSc
Danish Epilepsy Centre, Filadelfia

2. Core Research Team 2022

Sándor Beniczky MD, Ph.D.

Professor, Head of Department

- Editor-in-Chief, Epileptic Disorders
- Founding Co-Chair, ILAE Neurotechnology Section (2022-2023)
- Chair, EEG Task Force, ILAE Commission on Big Data
- Past-chair, Joint Taskforce on EEG of the International Federation of Clinical Neurophysiology (IFCN) and the International League Against Epilepsy (ILAE)
- Steering committee member, European Reference Network EpiCare
- Member, ILAE Commission on Diagnostic Methods
- Member, ILAE Education Council; coordinator of the Virtual Epilepsy Academy (VIREPA)
- Member, ILAE Publication Council
- Member, ILAE Congress Council
- Member, IFCN Guidelines Committee

Rikke Steensbjerre Møller, Ph.D.

Professor, Head of department

- Speaker of a thematic research column within Neuroscience Academy Denmark
- Scientific advisory board member: KCNA2 Foundation
- Scientific advisory board member: KCNT1 Foundation
- Member of EpiCARE: a European Reference Network for rare and complex epilepsies
- Member of the management team at Department of Regional Health Research, University of Southern Denmark, Odense, Denmark
- Member of the scientific committee: Residras; a European Registry of Dravet Syndrome

Guido Rubboli MD, Ph.D.

Professor, Senior Consultant

- Member of the Management Group of the Coordinating Panel on Rare Neurological Diseases of the European Academy of Neurology
- Member, Epilepsy Scientific Panel, European Academy of Neurology
- Member, Task Force “Transition in care from Childhood into Adulthood”, Member International League Against Epilepsy (ILAE)
- Member, scientific committee “Epilessia- Fuori dall’ombra (Epilepsy – Out of the shadow)”
- Director and tutor, VIREPA (Virtual Epilepsy Academy) ILAE, Advanced EEG Course
- Member of the scientific committee KCNT1 Foundation
- Member of the scientific committee KCNA2 Foundation
- Member, Executive Committee. European Reference Network for Rare Disease – EpiCARE
- Member of the Management Group of the Epilepsy Scientific Panel, European Academy of Neurology
- Member, Rare Diseases Scientific Panel on Epilepsy. European Academy of Neurology
- Member, ILAE Task Force “SNOMED-CT”
- Member Joint EAN/ EPNS Task Force on transition from childhood to adulthood
- Associate Editor, Epileptic Disorder
- Section Editor, Behavioral Neurology
- Associate Editor, Frontiers in Neurology
- Editorial board member, Epilepsy and Behavior Reports.

Marina Nikanorova MD, Ph.D.

Associate Professor, Senior Consultant

Elena Gardella MD, Ph.D.

Associate Professor, Senior Consultant

- Member of the commission on Classification and Terminology of the International League against Epilepsy (ILAE)
- Co-director of VIREPA basic-EEG course of the International League against Epilepsy (ILAE)
- Member of the board of the Danish Epilepsy Society (DES)
- Member of Molecular Therapeutic Board in Neurological Channelopathies EpiCARE: a European Reference Network for rare and complex epilepsies.
- Author/revisorof Orphacodes of Orphanet (member of the EpiCare- working group WG2)
- Coordinator the registry database and cofounder of the European STXBP1 consortium (ESCO)
- Member of a thematic research column within Neuroscience Academy Denmark (NAD)
- Member of the BRIDGE team at Department of Regional Health Research, University of Southern Denmark
- Member of the steering committee of the Danish Epilepsy Database of RKKP (Regionernes Kliniske Kvalitetsudviklingsprogram)
- Editor of Frontiers in Neurology
- Grant reviser for COST (European Cooperation in Science and Technology)
- Scientific advisory board member: SCN8A Italy Foundation
- Scientific advisory board member: SCN8A Europe Foundation
- Scientific advisory board member: SCL6A1 Foundation

Allan Bayat MD, Ph.D.

Translational Researcher, Consultant

- Post doctoral BRIDGE Translational researcher at University of Copenhagen in collaboration with Department of Clinical Genetics, Rigshospitalet and the Danish Epilepsy CenteCo-organizer of the Nordic Course on Epilepsy Genetics and Precision Therap
- Member of the ERN-Ithaca KBG Guideline Steering committe
- Member of NorEpiNET, a newly established Nordic educational network dedicated to fostering teaching and collaboration in both clinical and research aspects within the field of epilepsy
- Member of Epicare WG5 on neuropsychology

4. Conferences and congresses

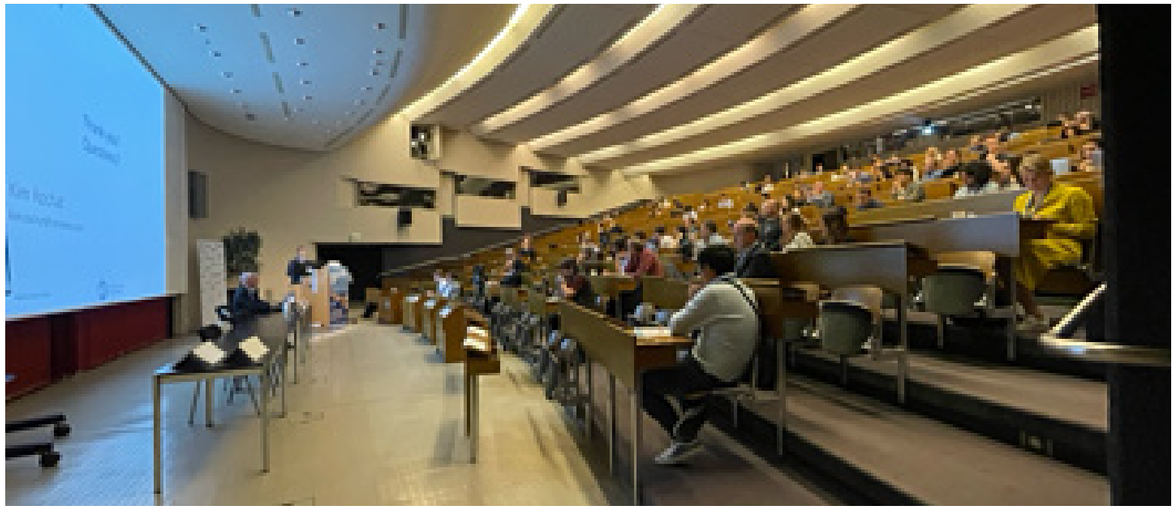
4.1 International Conference on Artificial Intelligence in Epilepsy and Neurological Disorders. March 7-10 2023. Breckenridge, CO, USA.

We have co-organized the first international conference on AI in epilepsy, co-chaired by Sándor Beniczky, Samden Lhatoo, Philippe Ryvlin and Michael Sperling.

The program included 33 lectures and 60 posters on cutting-edge research. The conference attracted over 200 participants, including leading authorities in this field.

4.2 4th International Congress on Mobile Health and Digital Technology in Epilepsy. October 11-13, 2023, Lausanne, Switzerland

We have co-organized the 4th international congress on mobile health and digital technology in epilepsy, co-chaired by Sándor Beniczky and Philippe Ryvlin. The biennial congress alternatingly held in Copenhagen and Lausanne, became a well-established meeting forum for neurotechnology research and development in epilepsy care. The program in 2023 included 25 lectures and 56 posters. The conference attracted 200 participants, including leading authorities in this field, with participants from all over the world.



4.3 Danish-Brazilian Workshop of Wearable Healthcare Technologies for the Central Nervous System. April 1st, 2023, Florianopolis, Brazil.

The objective of the workshop was to provide a dynamic ecosystem of information exchange among Danish and Brazilian health-tech industry, engineers, medical organizations, researchers, and healthcare professionals to develop new strategies for therapeutics and digital health innovations to converge and ultimately deliver better outcomes for patients with epilepsy. The program comprised eight lectures and three panel discussions, and was supported by a grant form the Danish Ministry of Higher Education and Science (International Network Program).

4.4 2nd SCN2A/SCN8A gathering and family meeting, 26-27.05.23, Køge, Denmark.

The objective of the workshop was to provide a dynamic ecosystem of information exchange among Danish and Brazilian health-tech industry, engineers, medical organizations, researchers, and healthcare professionals to develop new strategies for therapeutics and digital health innovations to converge and ultimately deliver better outcomes for patients with epilepsy. The program comprised eight lectures and three panel discussions, and was supported by a grant form the Danish Ministry of Higher Education and Science (International Network Program).

4.5 1st European STXBP1 Summit and Research Roundtable Milan on May 16-17-18, 2023

This is the first researchers and families gathering meeting for STXBP1 in Europe.
Including physicians, basic scientists family representatives, and pharma companies from several European countries (UK, Italy, France, Germany, Georgia, Switzerland), Israel, and the USA.
During the meeting were launched the European Consortium on STXBP1, for which we are co-founders, and the European STXBP1 Registry, which will be stored at the Danish Epilepsy Centre (Coordinator: Elena Gardella, Administrator: Francesca Furia) on behalf of the ESCO consortium

4.6 1st Nordic Course on Epilepsy Genetics and Precision Therapy, 20-21.11.23, Stockholm, Sweden

As part of NorEpiNet, Allan Bayat (MD, PhD), Cecilie Johannessen Landmark (Professor MScPharm), Kaja Selmer (MD, PhD), Rikke Steensbjerre Møller (Professor, MSc), Mathilda Modigh (Nurse, PhD student) and Tommy Stödberg (MD, PhD) organized this meeting with 70 physicians and basic scientists from the Nordic countries, UK and USA.

5. Research projects

5.1 Artificial Intelligence in epilepsy

Artificial intelligence (AI) is about to revolutionize healthcare, and this has reached the field of epilepsy. AI holds immense potential to improve efficacy and quality of diagnostic evaluations. Using AI, we developed and validated automated and semi-automated analysis methods of EEG and of video recordings with epileptic seizures.

In collaboration with University of Bergen and Holberg-EEG, we developed an AI-model for automated interpretation of routine, clinical EEGs. The AI-model was developed using an artificial neural network, based on large EEG datasets (over 30 thousand de-identified recordings), systematically labeled using the SCORE software (Standardized Computer-based Organized Reporting of EEG). SCORE-AI was tested on a multicenter test dataset, assessed by international experts, and a large, independent dataset from Oslo University Hospital. SCORE-AI reached performance equivalent to human experts in distinguishing normal from abnormal EEGs, and then classifying the abnormal EEGs into the categories with clinical relevance (focal epileptiform, generalized epileptiform, focal non-epileptiform, diffuse non-epileptiform).

The paper reporting SCORE-AI received much attention internationally. It appeared in numerous editorials, news, posts, tweets and blogs, giving an Altmetric score of 318. It was one of the most viewed articles in JAMA Neurology in 2023 (with close to 30 thousand views in less than 5 months).

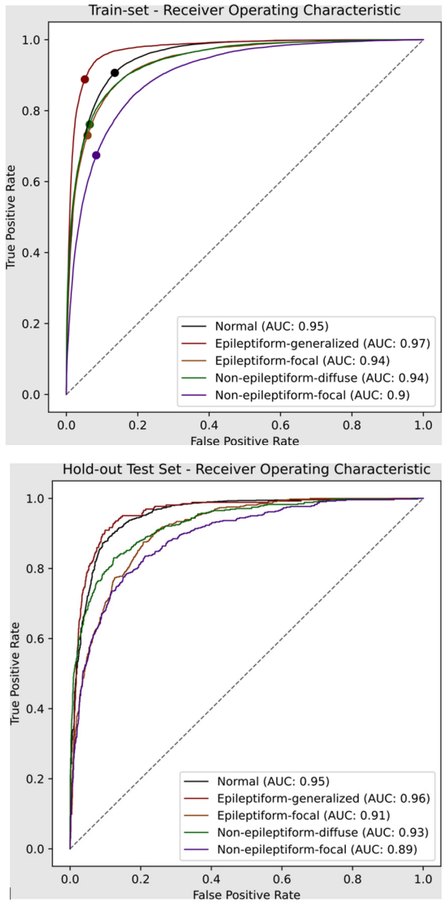


Fig. Receiver Operating Characteristic (ROC) curve of SCORE-AI, in the development and test datasets, demonstrating the high performance and generalizability of the model.

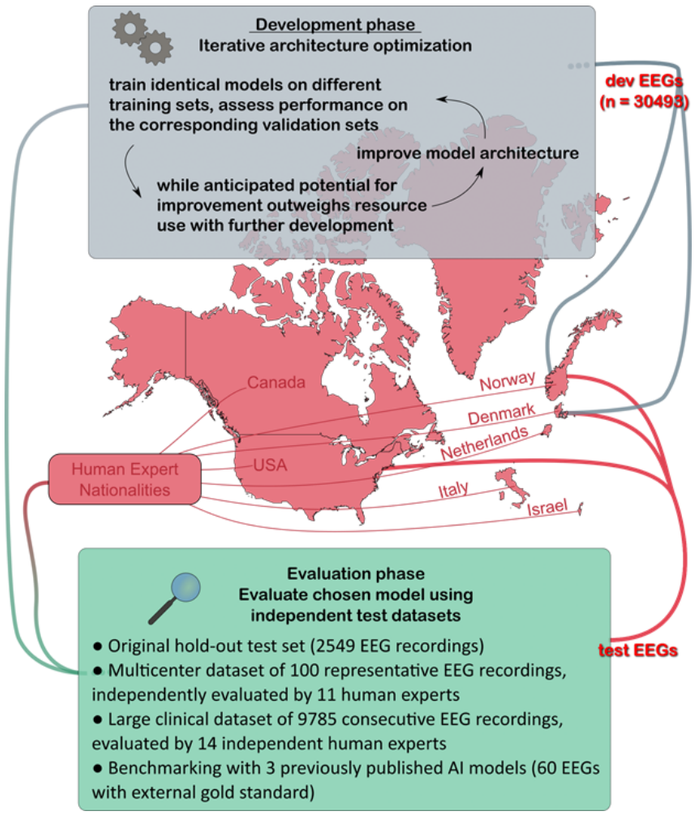

Fig. SCORE-AI: Flowchart of validation.

5.2 Big Data

Large structured datasets are essential for medical research. They make possible datamining and addressing clinical questions, based on a data-driven approach.

Since 2013, we have been using the Standardized Computer-based Organized Reporting of EEG (SCORE). The large dataset helped in addressing various clinical questions. In 2023, we published a paper establishing the duration of the epileptic seizure-types, based on real-world data from SCORE. These results are helpful in clinical practice, for identifying and classifying the various seizure types.

Based on a large international dataset with de-identified data from epilepsy surgery programs, we have validated and conducted a head-to-head comparison of tools for predicting outcome after surgery. We developed and validated a method for risk-stratification in this group of patients. We contributed to the analysis of a large Swiss dataset, to evaluate the diagnostic yield of prolonged EEG and MRI after the first seizures.

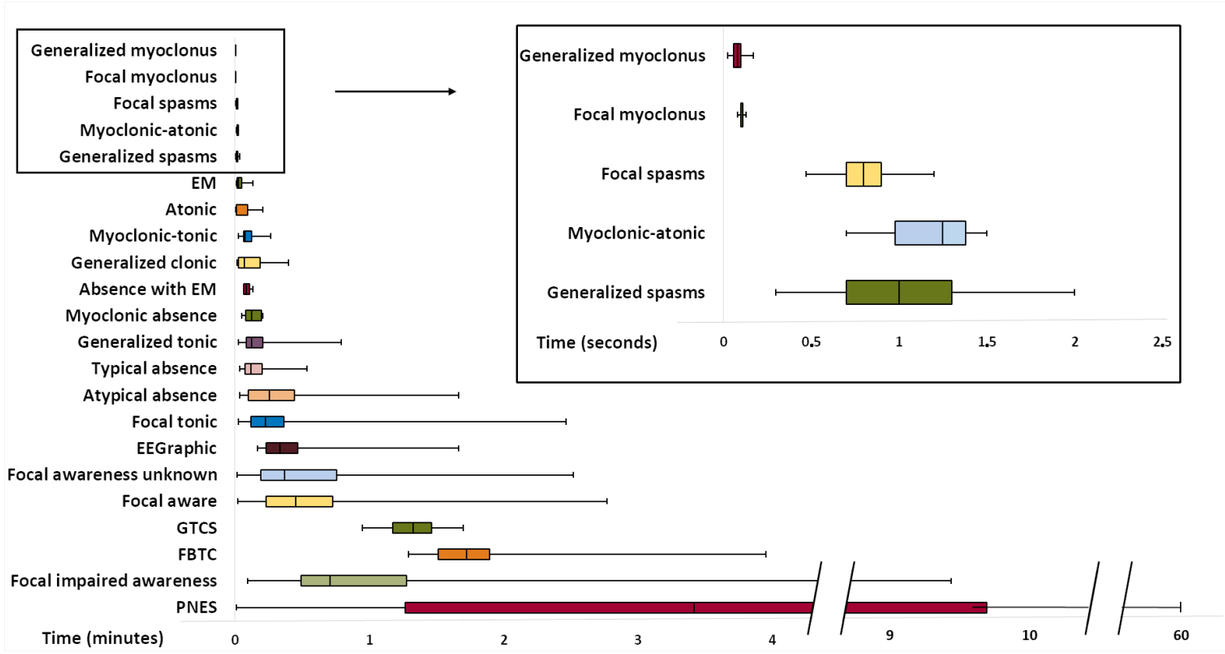

Fig. Duration of epileptic seizures, based on real-world data from SCORE.

5.3 Seizure detection & wearables

Automated detection of epileptic seizures using wearable devices is needed for safety indications and for objective quantification of seizure-burden. We continued our decades-long effort to develop and validate seizure detection wearables.

Using machine learning, we optimized our heart-rate variability (HRV) based seizure detection algorithm, which helped us decrease the false alarm rate. We conducted a proof-of-principle study and published a seminal paper on using subcutaneously implanted electrocardiogram (ECG) for automated seizure detection of epileptic seizure. This application has huge potential in clinical practice. It combines a hardware, which is well-established in cardiology, with a novel algorithm for seizure detection.

We have reviewed the state-of-the-art and current clinical practices in using wearables for seizure detection. These results will likely promote further research and development in this important field.

5.4 Guidelines & recommendations

Guidelines and recommendations, based on systematic assessment of published evidence, has an upmost importance for high quality clinical care. In 2023, we contributed to development of international guidelines on minimum standards for routine and sleep EEG, endorsed by both the International Federation of Clinical Neurophysiology and the International League Against Epilepsy. We participated in consensus-discussions and published a paper on using intravenous antiseizure medications for diagnosing status epilepticus. We contributed to the work of an international consortium to develop DICOM-format for EEG.

5.5 Education

Education and research in postgraduate education receive high priority in our hospital. We published educational review papers and multimedia teaching material to spread the new knowledge cumulated in our field. We critically addressed the impact and efficacy of various curricula and teaching methods.

5.5 GARA-A receptor related epilepsies

Developmental and Epileptic Encephalopathies (DEEs) are devastating early-onset conditions associated with intractable epilepsy, intellectual disability, developmental delay/regression, movement, and autism spectrum disorders. The condition is highly debilitating for both the impacted children and their caretakers. Genetic factors play a major role in the underlying cause of DEEs, and pathogenic variants in subunits of the γ-aminobutyric acid type A receptor (GABAAR), the major inhibitory protein of the brain, are found to be a common cause of DEE. Until recently, these were assumed to lead to loss-of-function (hypoactive) receptors supporting a hypothesis that reduced GABAergic inhibition causes overexcitation in the brain leading to epilepsy.

Recently, we have published exciting new data that contradicts the belief that only loss-of-function GABAARs cause DEE. We discovered that the functional assessment of pathogenic variants from a subset of GABAAR subunits, led to an equal distribution of loss- and gain-of-function receptors. It is currently unknown how increased GABAAR function leads to DEE, however, the paradoxical finding of gain GABAARs has subsequently been confirmed by others. Furthermore, we discovered that patient phenotypes were linked to the functional outcome of the variants and that gain variants are associated with more severe forms of treatment resistant epilepsy.

5.6 Education

Clinical and electrophysiological features of SCN8A variants causing episodic or chronic ataxia

Pathogenic variants in SCN8A are associated with a wide spectrum of epilepsies and neurodevelopmental disorders, including movement disorders and ataxia. Though, the non-epilepsy symptoms of SCN8A developmental and epileptic encephalopathy (DEE) have not been well studied. We set out to investigate disease mechanisms and genotype–phenotype correlations of SCN8A-related ataxia.

Variants associated with chronic progressive ataxia either decreased Na+ current densities and shifted activation curves towards more depolarized potentials. Three variants were associated with episodic ataxia causing loss-of-function by decreasing Na+ current densities or a hyperpolarizing shift of the inactivation curve. Two additional episodic ataxia-associated variants caused mixed gain- and loss-of function effects. Treatment with sodium channel blockers might exacerbate symptoms.

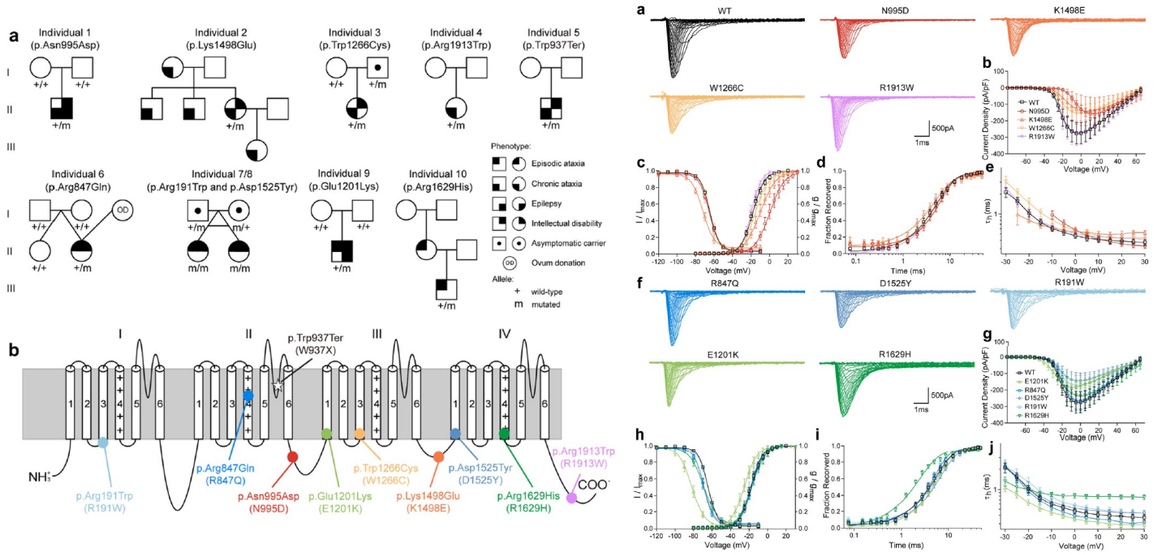

Fig. Right panels: SCN8A variants associated with episodic or chronic ataxia. (a) Pedigrees of study participants. (b) Position of variants in human Nav1.6 channel.

Left panels: Functional studies. (a) Representative traces of Na+ current for wild-type (WT) and SCN8A variants associated with chronic ataxia. 5.7 IRF2BPL as a novel gene for progressive myoclonus epilesy

Progressive myoclonus epilepsies (PMEs) are a heterogeneous group of severe diseases, still genetically unsolved in one third of the cases. IRF2BPL has recently been described as a novel cause of neuro-developmental disorders with multi-systemic regression, epilepsy, cerebellar and pyramidal signs.

The achievements of this study were:

1. to describe a novel IRF2BPL phenotype consistent with PME and
2. to identify clear-cut genotype-phenotype correlations, permitting to predict the evolution of the symptoms based on the type and position of the gene variant.
3. to provide insights into the pathophysiological mechanism leading to the IRF2BPL-PME phenotype. We observed that the skin biopsy revealed massive intracellular glycogen inclusions, resembling Lafora bodies. Notably, both the dysfunctional protein causing Lafora disease (malin) and the IRF2BPL protein act as E3 ubiquitin ligase. This suggests a possible similar pathogenic pathway between IRF2BPL PME, Lafora disease, and other storage disorder PME, opening the pathway for precision treatment approaches of IRF2BPL-PME.

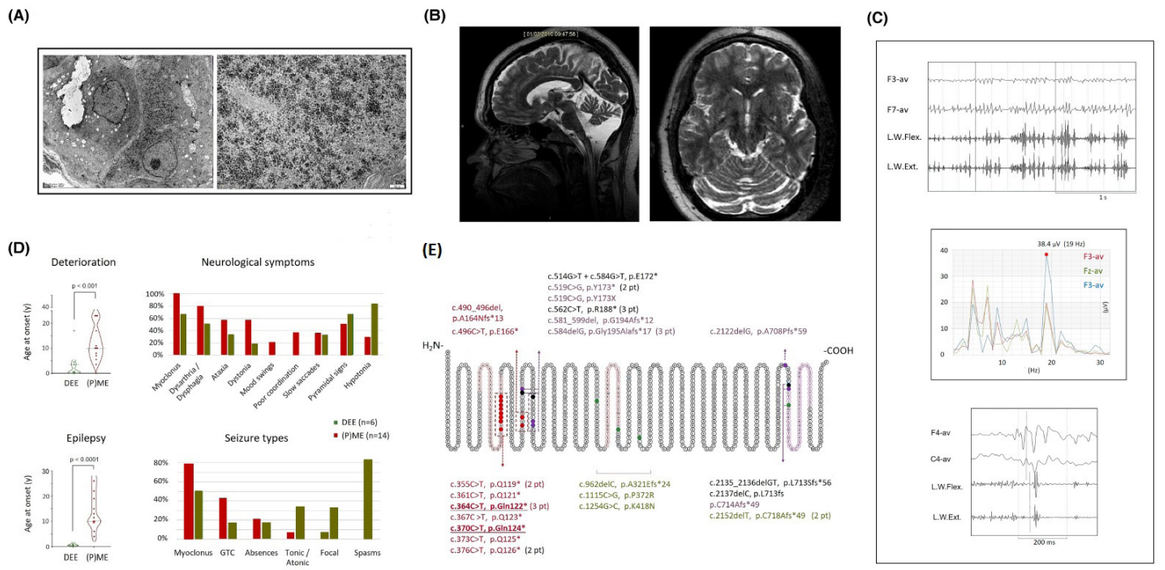

Fig. (A) Axillary skin biopsy. The electronic microscopy shows massive accumulations of glycogen particles free in the cytoplasm of the epithelial cells of a sweat gland. (B) Brain magnetic resonance imaging. CUBE T2-weighted images showing diffuse atrophy of the cerebellum and the bulbo-pontine structures. (C) EEG–EMG correlations. Surface EMG revealed rhythmic myoclonic jerks at a frequency of 11–22 Hz. The spectral EEG analysis revealed a frequency peak in the beta band (18–21 Hz). The EEG activity in the frontal regions (F4/F3) preceded the EMG activity in the contralateral wrist flexor muscles by 12.5–13.5 ms. (D) Clinical differences between subjects with IRF2BPL- developmental and epileptic encephalopathy [DEE] and [progressive] myoclonus epilepsy [(P)ME]). (D) IRF2BPL protein structure and variant position. The IRF2BPL includes two highly conserved domains—the coiled-coil (red circles) and the RING finger (purple circles), present in all members of the E3 ligase family, including malin. The positions of all the pathogenic IRF2BPL variants are indicated in green ([P]ME), red (DEE), purple (no epilepsy), or black (not further classified).

5.8 Atypical evolution of PRRT2 benign familial infantile seizures (BFIS) to encephalopathy related to status epilepticus during sleep (ESES)

Heterozygous variants in the PRRT2 gene are mostly associated with benign phenotypes, being the major genetic cause of benign familial infantile seizures (BFIS), as well as in paroxysmal disorders.
We report two children from unrelated families with BFIS that evolved to encephalopathy related to status epilepticus during sleep (ESES).

The mechanism leading to epilepsy and the phenotypic variability of PRRT2 variants remain poorly understood. However, its wide cortical and subcortical expression, in particular in the thalamus, could partially explain both the focal EEG pattern and the evolution to ESES. No variants in the PRRT2 gene have been previously reported in patients with ESES. Due to the rarity of this phenotype, other possible causative cofactors are likely contributing to the more severe course of BFIS in our probands.

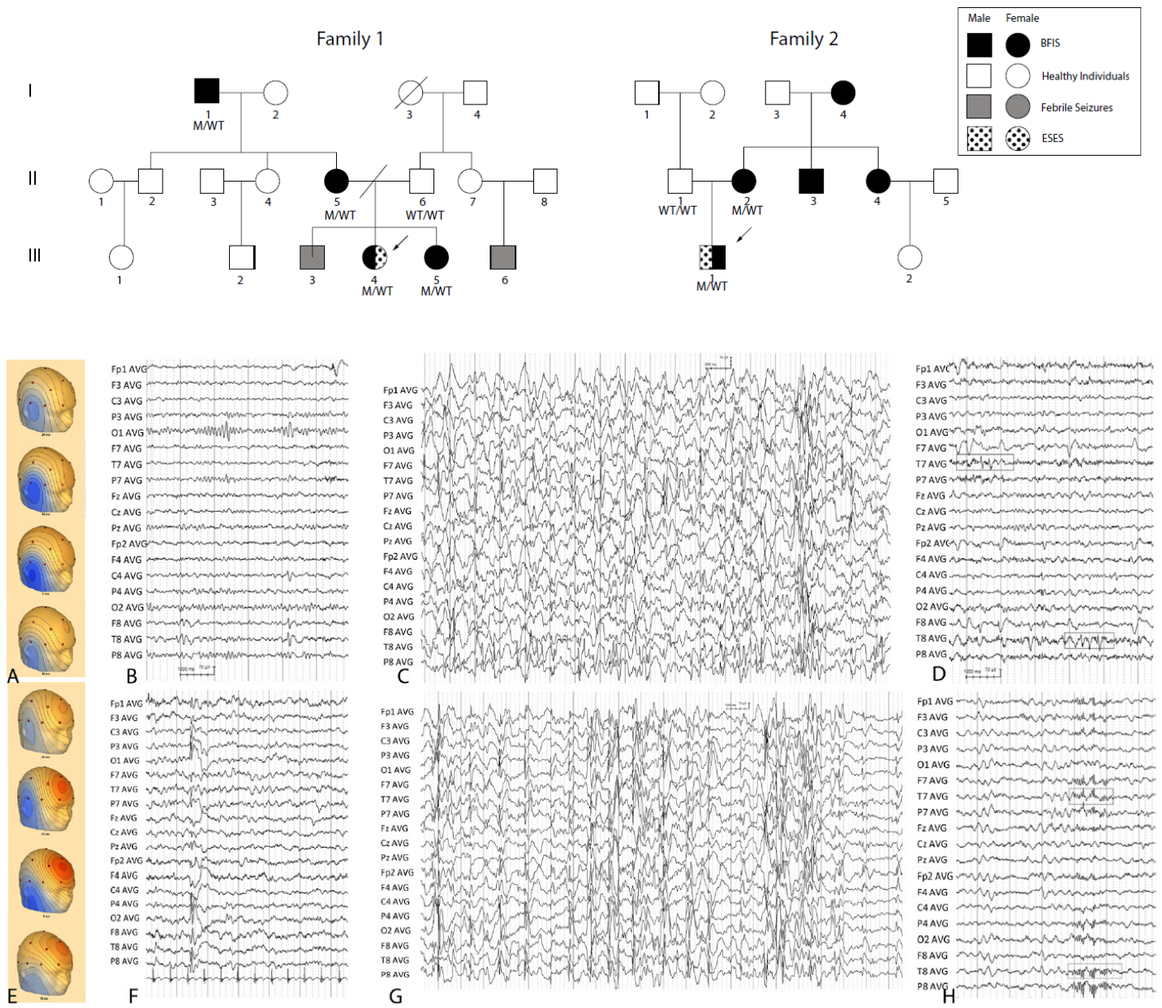

Fig. Pedigree of the Danish family (left) and of the Italian/Slovenian family (right) with benign familial infantile seizures (BFIS), febrile seizures (FS), and one case of encephalopathy related to status epilepticus during sleep (ESES). EEG analysis of P.1 (upper row) and P.2 (lower row): (A, E) sequential amplitude maps (10 ms interval) of IEDs during wakefulness, showing a dipole rotation between onset, peak, and slow wave. IEDs during wakefulness (B,F), NREM sleep (C, G = ESES pattern) and REM sleep (D, H).

5.9 Biology of Juvenile Myoclonic Epilepsy – BIOJUME Consortium" and "Variation in prognosis and treatment outcome in juvenile myoclonic epilepsy".

This research showed that by applying a simplified set of criteria to define phenotypic variations of juvenile myoclonic epilepsy, evidence-based definition and prognostic stratification of juvenile myoclonic epilepsy can be implemented. A simplified set of diagnostic criteria for juvenile myoclonic epilepsy includes the following: (i) myoclonic jerks as mandatory seizure type; (ii) a circadian timing for myoclonia not mandatory for the diagnosis of juvenile myoclonic epilepsy; (iii) age of onset ranging from 6 to 40 years; (iv) generalized EEG abnormalities; and (v) intelligence conforming to population distribution.

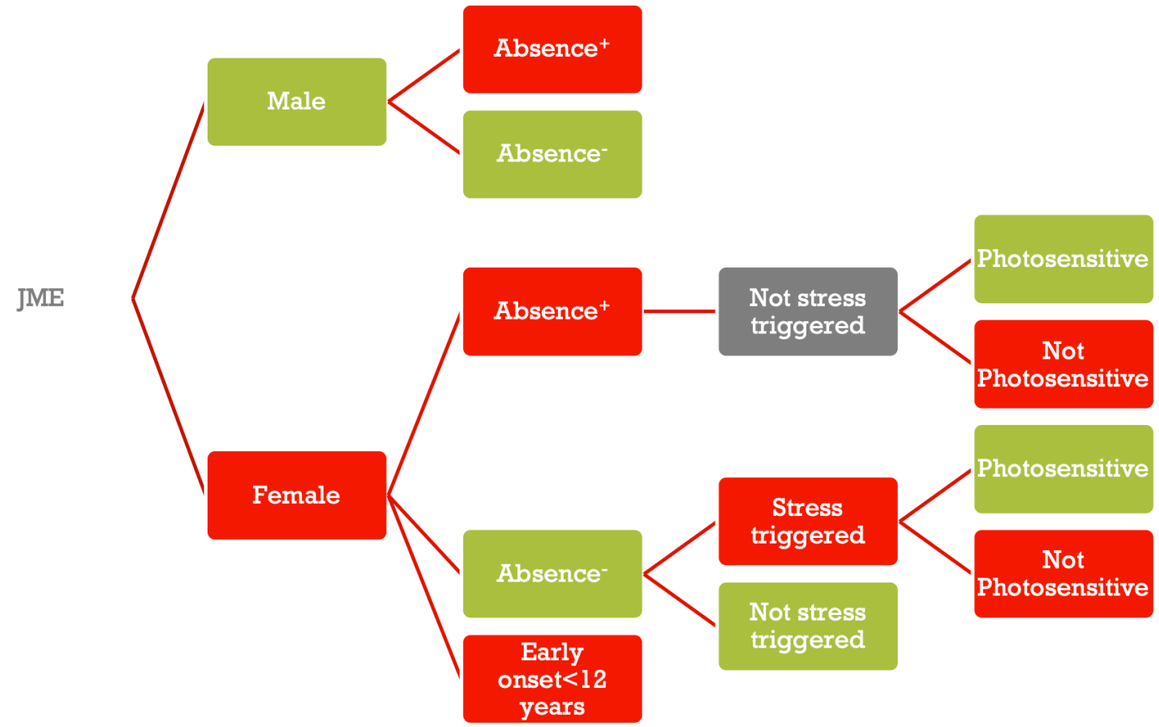

Fig. Proposed predictive model of ASM resistance in JME. At each stratum, blue denotes better prognosis, orange worse prognosis, and grey denotes neutral effect on outcome.

5.10 KCNT2-Related Disorders: Phenotypes, Functional, and Pharmacological Properties

This study outlined the phenotypic and genotypic spectrum of KCNT2-related disorders, highlighting novel genotype-phenotype associations. Pathogenic KCNT2 variants cause GoF or LoF in vitro phenotypes, and each shows a unique pharmacological profile.

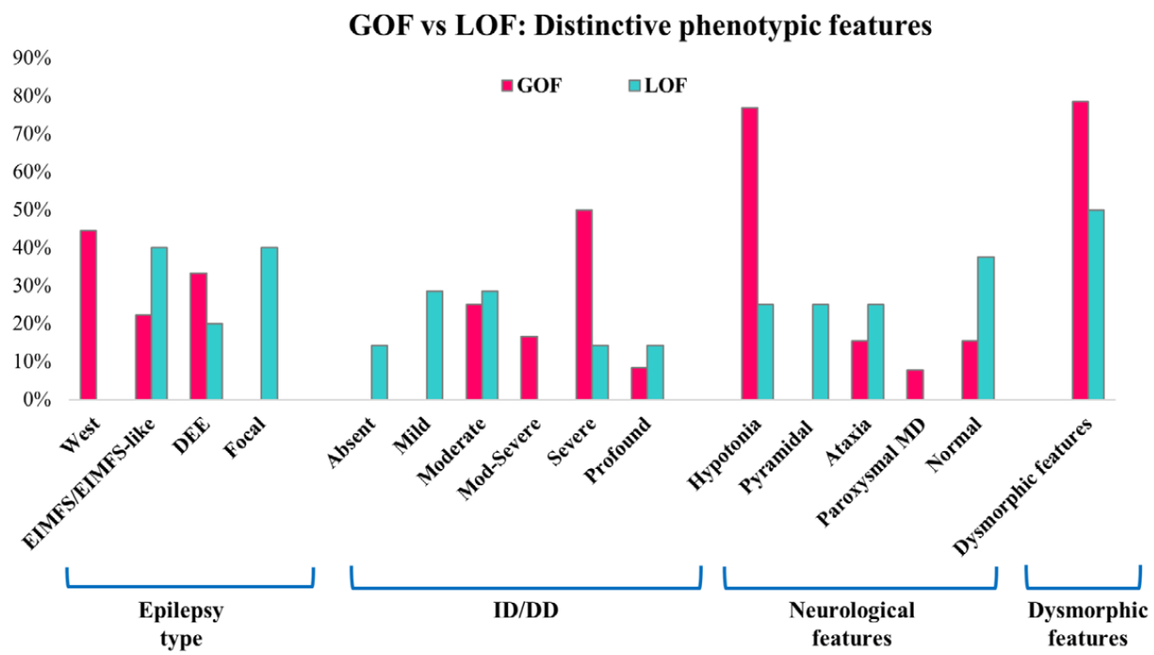

Fig. Representation of the main phenotypic features in patients carrying GoF (red bars) versus LoF variants (green bars); values are expressed as the percentage of patients presenting the trait out of the number of patients

5.11 SLC6A1: the past, present and future

A series of articles illustrated the current knowledge and the recent advances on SLC6A1-related neurodevelopmental disorders (SLC6A1-NDDs). However, there are still many aspects of this disorder that needs further elucidating. Moving closer to targeted treatment in SLC6A1-NDDs, further studies and research are warranted for a clear understanding of the disorder including the phenotypic range and natural history.

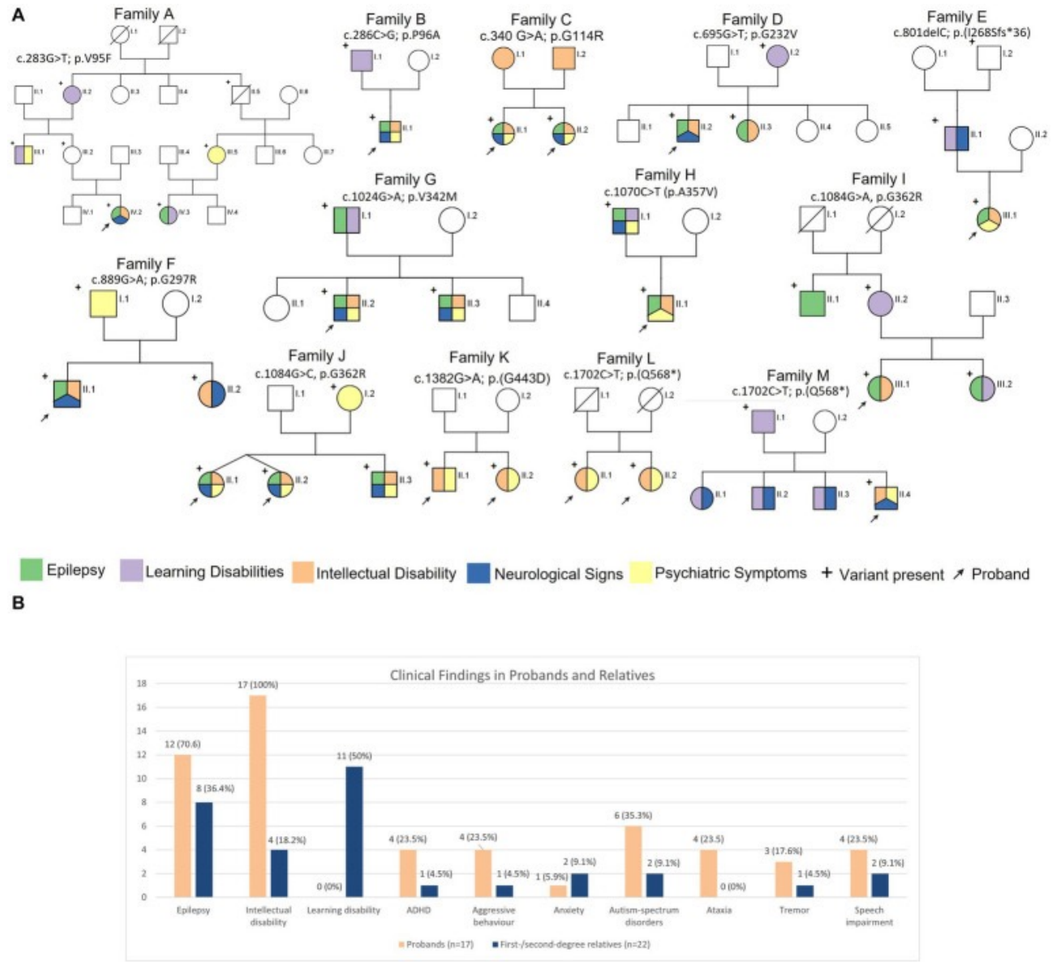

Fig. (A) Pedigrees of the 12 families featuring SLC6A1-relalted DEE and main clinical features in the reported families. (B) Bar graph illustrating the prevalence of the neurological features in the probands and first/second degree relatives. (Kassabian et al., Front Neurol 2023).

5.12 Developmental epileptic encephalopathy in DLG4-related synaptopathy

This study, in collaboration with Z. Tümer (University of Copenhagen) defined the phenotype of DLG4-related synaptopathy, demonstrating that a subgroup of individuals with DLG4-related synaptopathy has DEE, and around one fourth of them have ESES/DEE-SWAS, confirming DEE as part of the DLG4-related phenotypic spectrum.

5.13 Gain-of-function and loss-of-function variants in GRIA3 lead to distinct neurodevelopmental phenotypes

In an exciting advancement, we explored the impact of rare variants in AMPA receptors on neurodevelopmental disorders (NDD). Specifically, we investigated 43 missense and one frameshift variant in the GRIA3 gene, which encodes AMPA receptor subunits, unique on the X chromosome. Electrophysiological on oocytes and HEK cell assays revealed that 31 variants significantly altered receptor function, leading to loss-of-function (LoF) or gain-of-function (GoF) properties. By merging clinical data with functional results, we identified clinical biomarkers that could preduct if a GRIA3 variant could cause LoF or GoF.

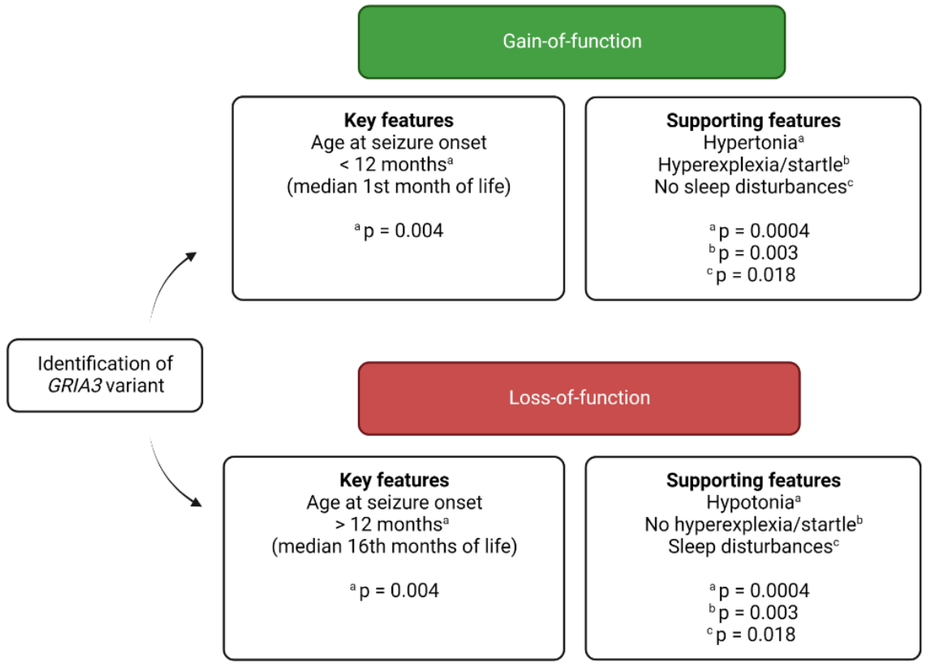

Fig. GRIA3 missense variants with gain-of-function and loss-of-function effects on AMPA receptors function lead to distinct clinical phenotype

5.14 Phenotypic and functional assessment of two novel KCNQ2 gain-of-function variants Y141N and G239S and effects of amitriptyline treatment

This study investigates the clinical features of patients with de novo KCNQ2 Y141N or G239S variants, revealing mild global developmental delay with language deficits but absence of neonatal seizures. Functional testing indicated a gain-of-function effect, supported by increased current densities and hyperpolarizing shifts in activation gating. Treatment with the Kv7 channel blocker amitriptyline showed promising results in improving motor, verbal, social, sensory, and adaptive behavior skills in one patient, suggesting it as a potential targeted treatment for KCNQ2 gain-of-function variants.

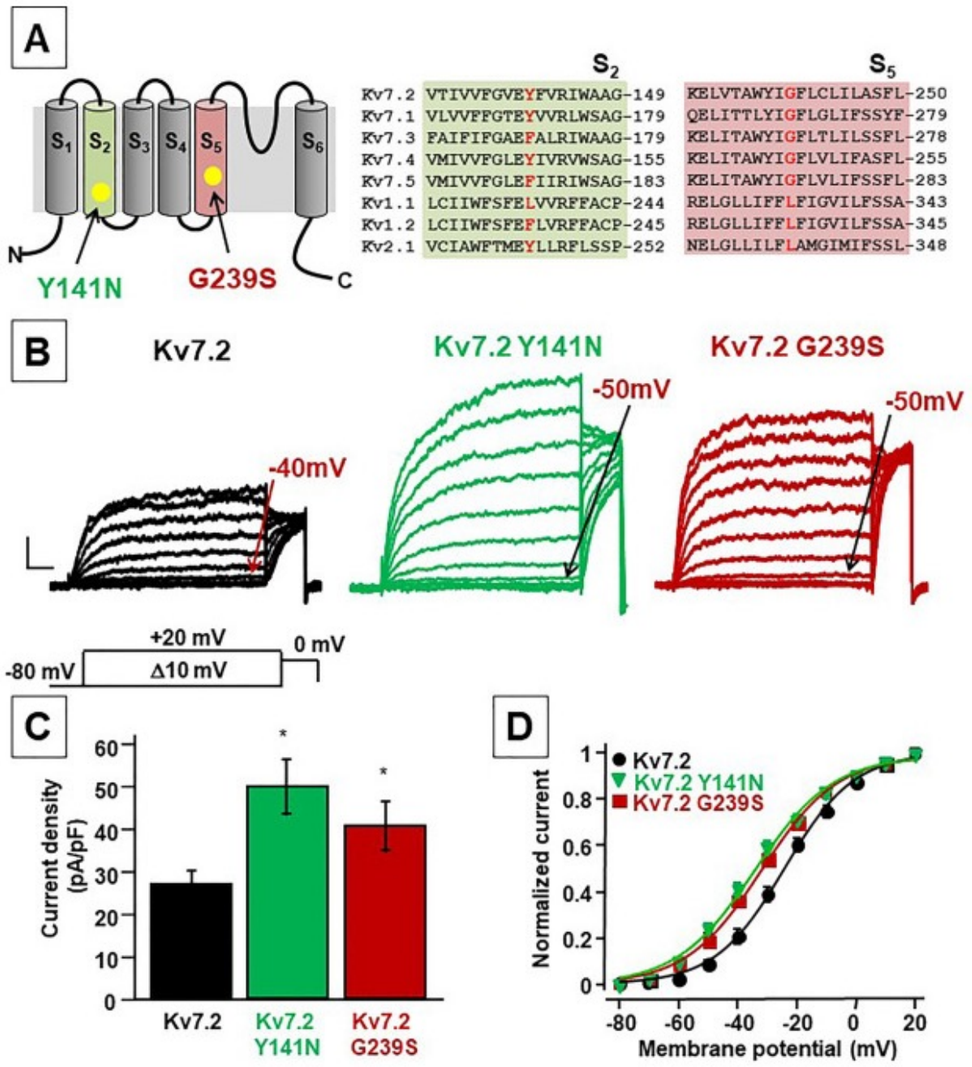

Fig. Schematic representation of a single Kv7.2 subunit, alignment and functional analysis of mutations at position Y141 and G239.

6. Lectures - oral presentations in 2023

Sándor Beniczky:

- Automated interictal and ictal EEG source imaging.
  Winter conference on brain research. January 20-25 2023, Snowbird, Utah, USA.
- Non-convulsive status epilepticus.
  10th NATIONAL EEG WORKSHOP UNDER THE AGEIS OF INDIAN EPILEPSY SOCIETY 2023. Online. February 22, 2023.
- Automated seizure detection using wearables: are we there yet?
  Automated interpretation of clinical EEG using AI.
  International Conference on Artificial Intelligence in Epilepsy and Neurological Disorders. March 7-10 2023. Breckenridge, CO, USA.
- New advances in Clinical Neurophysiology.
  Presidential symposium at the Annual Meeting of the Epilepsy Societies of Austria, Germany and Switzerland. March 16, Berlin, Germany.
- Science of EEG Source Localization- Understanding the Value of Electrical Dipoles.
  Annual Meeting of the American Clinical Neurophysiology Society (ACNS). March 25-29, 2023, Austin, Texas, USA•
- Automated seizure detection using wearables: state-of-the-art.
  First Danish-Brazilian workshop on automated seizure detection. April 1 2023, Florianopolis, Santa Catarina, Brazil.
- Epileptiform and Non-epileptiform Abnormalities on Routine EEG.
  The 75th Annual Meeting of the American Academy of Neurology. April 22-27, 2023, Boston, Massachusetts, USA.
- Paroxysmal non-epileptic events.
  EEG and semiology.
  Interictal EEG abnormalities.
  Annual workshop of the Irish Society of Clinical Neurophysiology. April 28 2023, Dublin, Ireland.
- How to find lesion in non-lesional focal epilepsies, using EEG source imaging
  European Congress of Clinical Neurophysiology. May 9-12, Marseille, France.
- What is a Spike and does it harm the Brain?
  Colloquium Update on Rare Neurological Diseases. May 12, 2023, Salzburg, Austria.
- Machine learning and future of EEG.
  Annual meeting of the Turkish Epilepsy Society. May 26-28, 2023 Sapanca, Turkey.
- Behavioral testing during and after seizures.
  EpiCare: Nurses & EEG technicians workshop on best practices in Epilepsy Monitoring Units. May 31, 2023. Utrecht, the Netherlands.
- When is a spike a spike and a seizure a seizure?
  Online Epilepsy Seminars of the George Washington University, Washington DC, USA. June 13, 2023.
- Seizure detection using wearable devices.
  Online Grand Rounds of the New Your University, NY, USA. June 14, 2023.
- Using digital solutions to transform the delivery of clinical trials and research.
  The 9th European Academy of Neurology congress. July 1-4, Budapest, Hungary.
- Seizure detection using wearable devices.
  Systematic EEG reading.
  EEG source imaging.
  35th International Epilepsy Congress, September 2-6, 2023, Dublin, Ireland.
- Challenges to unify seizure classification and semiology terminology.
  15th International Epilepsy Colloquium. September 19-22. Cleveland, Ohio, USA.
- Artificial Intelligence and Epilepsy.
  McMaster Pediatric Neurology Rounds. September 22, 2023, online.
- Focal and generalized seizures: electroclinical correlations.
  Epilepsy Symposium at Karolinska University. September 29, Stockholm, Sweden.
- Digital technology in epilepsy trials.
  EpiCare webinar. October 5, 2023, online.
- Automated and semi-automated interpretation of EEG.
  4th International Congress on Mobile Health and Digital Technology in Epilepsy. October 11-13, 2023, Lausanne, Switzerland.
- Wearables and seizure counting: are we there yet?
  XXVI World Congress of Neurology (WCN 2023). October 15-19, 2023. Montreal, Canada.
- Wearable and seizure counting: Are we there yet?
  Lundbeck Science Forum Neurology. November 16-17, 2023. London, UK.
- Nonconvulsive status epilepticus in critically ill patients should not be treated aggressively.
  Annual Meeting of the American Epilepsy Society. December 1-5, 2023. Orlando, Florida, USA.
